

WHAT IS CLAIMED IS:

1. A print control program executed by an information processing apparatus, comprising:

5 a spooling step of spooling print data created and spooled via a print data creation module again; and

a control step of concurrently performing the spooling of the print data of said spooling step and output of the print data to a resending destination
10 or an alternate device.

2. The print control program according to claim 1, further comprising:

15 an ID creation step of creating a first ID issued correspondingly to the print data created via said print data creation module and a second ID to the print data spooled in said spooling step apart from said first ID; and

20 a management step of performing job management corresponding to the second ID created in said ID creation step.

3. The print control program according to claim 2, wherein the first ID is an ID issued via an OS.

25

4. The print control program according to claim 1, wherein, on alternation or resending of said print

data, said control step continues the spooling of the data already spooled before the alternation or resending.

5 5. The print control program according to claim 1, further comprising:

 a notification step of notifying said second ID to an alternation destination printer specified of a plurality of printers via an alternate setting

10 screen;

 an identification step of identifying the print data to be alternated based on said second ID notified in said notification step; and

 a reading step of reading the print data
15 identified in said identification step, and

 said control step concurrently processes the spooling of the print data in said spooling step and said reading step.

20 6. The print control program according to claim 1, wherein each of said plurality of printers has port information set up correspondingly.

 7. A storage medium having a print control
25 program to be executed by a computer stored therein in a computer-readable form, wherein the program comprises:

a spooling step of uniquely spooling print data created and spooled via a printer driver again; and

a control step of concurrently performing the spooling of the print data of said spooling step and
5 output of the print data to a resending destination or an alternate device.

8. The storage medium according to claim 7, wherein the program further comprises:

10 an ID creation step of creating a first ID issued correspondingly to the print data created via said printer driver and a second ID to the print data spooled in said spooling step apart from said first ID; and

15 a management step of performing job management corresponding to the second ID created in said ID creation step.

9. The storage medium according to claim 8,
20 wherein the first ID is an ID issued via an OS.

10. The storage medium according to claim 7, wherein, on alternation or resending of said print data, said control step continues the spooling of the
25 data already spooled before the alternation or resending.

11. The storage medium according to claim 7,
wherein the program further comprises:

5 a notification step of notifying said second ID
to an alternation destination printer specified of a
plurality of printers via an alternate setting
screen;

an identification step of identifying the print
data to be alternated based on said second ID
notified in said notification step; and

10 a reading step of reading the print data
identified in said identification step, and

said control step concurrently processes the
spooling of the print data in said spooling step and
said reading step.

15

12. The storage medium according to claim 7,
wherein each of said plurality of printers has port
information set up correspondingly.

20 13. An information processing apparatus for
exerting print control, comprising:

a spooling unit, adapted for again spooling
print data created and spooled via a print data
creation module; and

25 a control unit, adapted for concurrently
performing the spooling of the print data by said
spooling unit and output of the print data to a

resending destination or an alternate device.

14. The information processing apparatus according to claim 13, further comprising:

- 5 an ID creation unit, adapted for creating a first ID issued correspondingly to the print data created via the print data creation module and a second ID to the print data spooled by said spooling unit apart from said first ID; and
- 10 a management unit, adapted for performing job management corresponding to the second ID created by said ID creation unit.

15. The information processing apparatus according to claim 14, wherein the first ID is an ID issued via an OS.

16. The information processing apparatus according to claim 13, wherein, on alternation or

20 resending of said print data, said control unit continues the spooling of the data already spooled before the alternation or resending.

17. The information processing apparatus according to claim 13, further comprising:

25

 a notification unit, adapted for notifying said second ID to an alternation destination printer

specified of a plurality of printers via an alternate setting screen;

an identification unit, adapted for identifying the print data to be alternated based on said second
5 ID notified by said notification unit; and

a reading unit, adapted for reading the print data identified by said identification unit,

wherein said control unit concurrently performs the spooling of the print data by said spooling unit
10 and the reading by said reading unit.

18. The information processing apparatus according to claim 13, wherein each of said plurality of printers has port information set up
15 correspondingly.
